### Computations of Chemically Reacting Flow

Habib N. Najm

Sandia National Laboratories Livermore, CA

BES-NERSC Workshop, Washington DC, 2/9-10/2010

#### Overview

- Collaborators:
  - J. Prager, B. Debusschere, J. Ray, C. Safta
    - Sandia National Labs
  - M. Valorani, Univ. of Rome
  - D. Goussis, Nat. Tech. Univ. of Athens
  - O. Knio, Johns Hopkins Univ.
  - M. Frenklach, UC Berkeley
- Goal: Advance understanding of chemically reacting flows
- Approach:
  - Development of efficient algorithms and codes for multdimensional low Mach number reacting flow computations and analysis
  - Computational studies of low Mach number reacting flow with detailed chemical kinetics
  - Development of validated reduced chemical models

2/18

### Science Objectives for the Next 3-5 Years

- Study the structure and dynamics of
  - Edge flames
  - Lifted laminar jet flames
- Address fuels over a range of complexity
  - Methane, nHeptane, isoOctane
- Examine dependence of flame structure/dynamics on mixture composition and flow details
- Experimental comparisons

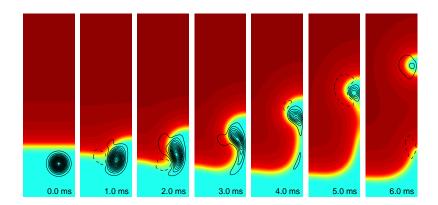

3/18

# Computational Challenges in low Mach Number Reacting Flow Modeling

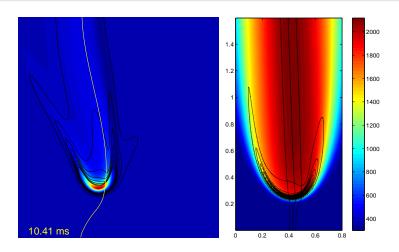

- Large range of length scales
  - Combustion system size O(0.01−10) m
  - Internal flame structures  $\mathcal{O}(100)\mu\text{m}$
  - Turbulence length scales
    - on the order of flame length scales at high Re
- Large range of time scales
  - Flow time scales can be slow:  $\mathcal{O}(10)$  ms
  - Fast chemical time scales:  $\mathcal{O}(1)$  ns
- Chemical model complexity
  - Methane-air  $\sim$  53 sp
  - nHeptane-air ∼ 560 sp
  - isoOctane-air ∼ 870 sp
- Multiphase, Radiation, Turbulence

#### Flame Vortex Interaction

## **Edge Flames**

#### **Dimensionless Low Mach Number Equations**

$$\begin{split} \frac{\partial \rho}{\partial t} + \nabla \cdot (\rho \mathbf{v}) &= 0 \\ \frac{\partial (\rho \mathbf{v})}{\partial t} + \nabla \cdot (\rho \mathbf{v} \mathbf{v}) &= -\nabla p + \frac{1}{\text{Re}} \nabla \cdot \left\{ \mu [(\nabla \mathbf{v}) + (\nabla \mathbf{v})^T] - \frac{2}{3} \, \mu (\nabla \cdot \mathbf{v}) \mathbf{U} \right\} \\ \rho c_p \frac{DT}{Dt} &= \frac{(\gamma - 1)}{\gamma} \frac{dp_o}{dt} + \frac{1}{\text{RePr}} \nabla \cdot (\lambda \nabla T) - \frac{\rho}{\text{ReSc}} \sum_{i=1}^N c_{p,i} \mathbf{V}_i \cdot \nabla T - \text{Da} \sum_{i=1}^N h_i \mathbf{w}_i \\ \frac{\partial (\rho Y_i)}{\partial t} + \nabla \cdot (\rho \mathbf{v} Y_i) &= -\frac{1}{\text{ReSc}} \nabla \cdot (\rho Y_i \mathbf{V}_i) + \text{Da} \, \mathbf{w}_i \qquad i = 1, \dots, N \\ p_o &= \frac{\rho T}{\overline{\mathbf{w}}} \end{split}$$

- Low Mach No., no body forces, bulk viscosity, or radiation
- Ideal gas, neglect Soret & Dufour effects U is the unit tensor

Density and Species update

$$\frac{\partial \rho}{\partial t} = \rho \left( -\frac{1}{T} \frac{\partial T}{\partial t} - \overline{W} \sum_{i=1}^{N} \frac{1}{W_i} \frac{\partial Y_i}{\partial t} \right)$$

$$\frac{\partial (\rho Y_i)}{\partial t} = -\nabla \cdot (\rho v Y_i) - \frac{1}{\text{ReSc}} \nabla \cdot (\rho Y_i V_i) + \text{Da } w_i \qquad i = 1, \dots, N$$

Projection scheme solution for v

$$\begin{split} \frac{\partial(\rho\hat{\mathbf{v}})}{\partial t} &= -\nabla \cdot (\rho \mathbf{v} \mathbf{v}) + \nabla \cdot \left\{ \mu [(\nabla \mathbf{v}) + (\nabla \mathbf{v})^T] - \frac{2}{3} \mu (\nabla \cdot \mathbf{v}) \mathbf{U} \right\} \\ \nabla^2 p &= \frac{1}{\Delta t} \left[ \nabla \cdot (\rho \hat{\mathbf{v}}) + \frac{\partial \rho}{\partial t} \right]; \qquad \rho \mathbf{v} = \rho \hat{\mathbf{v}} - \Delta t \nabla p \end{split}$$

- Alternate constructions
  - $(T, Y_i)$  rather than  $(\rho, \rho Y_i)$  update
  - v rather than  $(\rho v)$  projection

## Time Integration of Stiff PDEs

Species and energy conservation equations

$$\frac{\mathrm{d}u}{\mathrm{d}t} = C + D + R$$

- Explicit: Stiffness necessitates ~ 1 ns time steps
- Implicit:
  - Ok w/stiffness, but no need for implicit convection
- IMEX: Additive Implicit R, Explicit C + D
  - Deals well with chemical stiffness
  - Challenged by explicit diffusional stability
- Operator-Split:  $C_{\Delta t/2}D_{\Delta t/2}R_{\Delta t}D_{\Delta t/2}C_{\Delta t/2}$ 
  - Explicit C
  - Explicit Runge Kutta Chebyshev (RKC) D
  - Implicit R

#### Computational Performance – NERSC Franklin

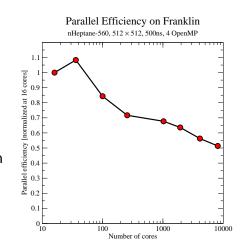

Cray XT4; 9,532 compute nodes; 2.3 GHz quad-core AMD Opt.

CPU Time per time step,  $512 \times 512$  mesh, 100 cores:

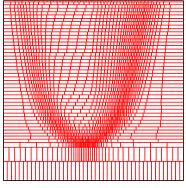

Mech	Parallelism	LINPACK	LAPACK	LAPACKopt	$LAPACK^{\mathrm{opt}}_{\mathrm{nJ}}$
M560	MPI/OpenMP	198 min	53 min	22 min	37 min
	MPI only	_	_	25 min	37 min
M139	MPI/OpenMP	79 sec	90 sec	56 sec	121 sec
	MPI only	_	_	67 sec	120 sec
M66	MPI/OpenMP	20 sec	21 sec	17 sec	33 sec
	MPI only	_	-	22 sec	33 sec

### Scalability - NERSC Franklin

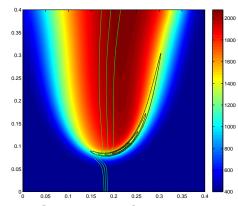

- 2D nHeptane edge flame
- 560 species, 2538 rxns
- Fixed 512×512 mesh
- 51% parallel efficiency on 8000 cores

### nHeptane Edge Flame – M560 – NERSC Franklin

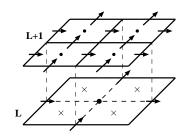

**Domain Decomposition** 

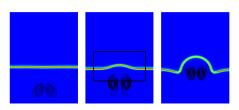

Global Flame Structure

## Adaptive Mesh Refinement

- Structured mesh hierarchy
- Mesh libraries
  - Grace, Chombo
- High order spatial derivatives, interpolants, and filters
- Fourth-order low Mach reacting flow construction

## Current HPC Requirements — Franklin

- Typical problems
  - Methane-air premixed flame-vortex
  - nHeptane edge flame
- # cores: 500-2000
- Aggregate Memory: 24 GB
- I/O per Run: 20 GB, 6 GB checkpoint files
- On-Line Storage: 30 GB
- Software and Services:
  - DVODE/sundials, LAPACK, hypre, Chombo, NERSC Consulting, craypat
- Data Transfer: 80 GB/yr

## Current HPC Requirements — Primary codes

#### dflame:

- 2D uniform mesh finite-difference Fortran-77
- 2<sup>nd</sup>-order in space and time
- Projection scheme for momentum equations FFT Poisson elliptic pressure solver
- Operator Split implicit/explicit time integration
- MPI+OpenMP parallelism

#### cfrfs:

- 2D Structured Adaptive mesh finite difference CCA + {C++, C, Fortran-77}
- 4<sup>th</sup>-order in space. 2<sup>nd</sup> in time
- Projection scheme for momentum equations hypre GMRES elliptic pressure solver
- Operator Split implicit/explicit time integration
- MPI parallelism

15/18

#### dflame:

- Uniform mesh
- 50% strong scalability at 8000 cores
  - Need to evaluate if/how this can be improved

#### cfrfs:

- MPI but no OpenMp
- Dynamic load balancing is more challenging
- Have yet to explore scalability in the O(10) K core range

## Future HPC Requirements — 3-5 Years

- Methane/nHeptane/isoOctane edge and jet flames
- # cores: ~ 100K
- 35M computational hrs
  - − Presuming ~ 60% parallel efficiency
- Aggregate Memory: 1-2 TB
- I/O per Run: 1-10 TB, 100-250 GB checkpoint files
- On-Line Storage: 3 TB
- Data Transfer: 10 TB/yr
- Archival Storage: 15 TB

### Impact of 50× NERSC Resources Now

- For a given mesh size, and N species:
  - Memory  $\propto N$
  - CPU  $\propto N^2$
- $N_{\rm nHeptane}/N_{\rm methane} \sim 10$

Factor of 50 enables doing roughly the same methane flame with detailed nHeptane models

Enables parametric runs of laboratory-scale laminar flames with detailed nHeptane chemistry

However, we need to address parallel efficiency before we could go beyond  $\mathcal{O}(10 K)$  cores
